A Spiritual Heir to the Macintosh

The Canon Cat may be Jef Raskin’s long-sought “information appliance”

Ezra Shapiro is a consulting editor for BYTE. Contact him at P.O. Box 146069, San Francisco, CA 94114. Because of the volume of mail he receives, Ezra, regretfully, cannot respond to each inquiry.

**Canon Cat**

**Company**

Canon U.S.A., Inc.
One Canon Plaza
Lake Success, NY 11042-9979
(515) 688-7000

**Size**

10 1/4 by 13 1/2 by 17 1/4 inches; 17 pounds

**Components**

**Processor:** 68000 running at 5 MHz
**Memory:** 256K bytes
**Mass storage:** One 256K-byte internal 3 1/2-inch floppy disk drive
**Display:** 9-inch black and white built-in bit-mapped screen
**Keyboard:** Compatible with IBM Selectric typewriter plus control functions on front of key caps
**I/O interfaces:** One Centronics parallel port, one RS-232C serial (DB-25) port, and two RJ-11 jacks (one to external telephone, one to telephone line)
**Modem:** Internal 300/1200 bps

**Software**

Contained in ROM, it includes word processing, mail merge, calculation, communications, data retrieval, and programming in Forth or assembly language

**Price**

$1495

---

**Putting the Cat to Work**

It's the software for the Cat that really shows off Raskin's conceptual touch. The basic interface is a simple text editor; you can sit down at the keyboard and just start typing. Initial defaults are set for a standard business page, so a novice can begin producing letters and memos almost immediately.

The Cat's full-size keyboard is almost identical to those of the IBM Selectric typewriter and its competitors. Although several new keys have been added to the layout, the business typist will notice no anomalies. The period and comma keys, for example, generate those characters in either shifted or unshifted mode.

While the tops of the key caps adhere to the office standard, computer commands are printed on the front face of many of the keys. The $L$ key is marked Disk, the $J$ key is marked Print, and so on. You trigger these special functions the same way you use Control-key combinations on a computer keyboard. However, the Cat's Control key is labeled simply Use Front—meaning use the command that is printed on the front of the key cap.

So, for example, to access the context-sensitive help screens (48K bytes' worth), you press the Use Front key together with the $N$ key, which says Explain on the front of its key cap. A Setup command—the $1/2$ key—lets you change system parameters like margins, printer types, character set, and so on. An Undo command lets you reverse your last action.

The display looks as much like a typewriter with a sheet of paper as you can get on a CRT screen. Black characters on a white background extend upward from a hollow box superimposed on the ruling bar; the effect is similar to a typewriter's paper bail. Small symbols below the ruler show line spacing, justification, memory usage, and so on.

The Cat holds 160K bytes in RAM, which is roughly equivalent to 80 single-spaced typewritten pages. You move through your data by holding down one of two extra keys located in front of the spacebar and typing a string of characters; the Cat jumps to the next occurrence of that string. The right-hand key initiates forward searches; the left-hand key, backward searches. If the search string doesn't find a match, the cursor returns to your starting position. In Cat jargon, these two keys are called Leap keys.

Raskin claims that scrolling from the top to the bottom of a full 8 1/2 by 11-inch page takes 8 seconds if you're pressing a cursor key, 4 seconds if you're using a mouse and scroll bars, and only 2 seconds with this Leap-key search mechanism. The disparity becomes more pronounced if you're trying to move longer distances with any precision.

Aborting a Leap operation is as easy as adding a few nonsense characters to the search string; the Cat won't be able to find it, and you'll be back where you started. Raskin suggests slapping your hand lightly in the center of the keyboard, an action likely to produce the required gibberish.

The Leap keys are also used to highlight text. You can delete, copy, or move highlighted blocks or check them for spelling mistakes with the built-in dictionary. If a highlighted block happens to be a mathematical formula, one keystroke calculates the result. The answer appears on the screen with a dotted underline; highlighting it and hitting a command sequence reveals the original formula, which you can then edit and recompute.

If the highlighted text is a computer program written in either Forth or 68000 assembly language, the Cat executes it. You can use a highlighted columnar table as the raw data for a full mail merge. Since you can assign sequences of commands mixed with text to each of the numeric keys at the top of the keyboard (accessed with the Use Front key), you can create complex macros or store boilerplate text.

One keystroke also dials a highlighted telephone number either for voice communications or to initiate a session with a remote computer; ASCII data simply flows into RAM as a long text document, which you can then manipulate as you would any other text. The incoming data stream is buffered in RAM, so if it doesn't require constant attention, you can move to another document and continue working.

**Documents and Disks**

The Cat environment is essentially one long text stream broken into pages. The software automatically inserts page breaks, but you can force a new page or start a new document whenever you want to. Forcing a document break resets a page-number counter to zero. Independent files do not exist per se, but if you don't want to use Leap searches to locate a specific document, the Cat lets you assign a title to any region started with a forced document break.

The machine uses a 256K-byte disk format, which holds the entire contents of the Cat's RAM plus configuration parameters, personal additions to the dictionary, system information, and a bit map of the last screen saved to disk.

There are several advantages to this system. First, you're always working in RAM, so you're always at full speed. Disk operations are reduced to swapping the entire load of RAM, which reduces
the risk of error. If you plug a disk into an idle Cat, it loads the contents of the disk, and you're ready to go. If the disk is unformatted, the Cat beeps at you: Executing the Disk command formats the disk and starts you off with a clean slate.

If you pull your disk out of the machine without saving, the Cat beeps. Insert the disk, and the Cat saves and continues. Insert a blank disk, and the Cat formats and saves your current RAM. Insert an already-used Cat disk, and the Cat beeps again, inquiring if you really want to erase it and save the current RAM; you have to hit the Disk key again to erase the disk.

Second, because each disk contains all configuration information as well as data, if you move a disk to another machine, you move your environment with you. You don't have to hassle with setting up parameters every time you switch Cats; that's all done automatically.

Finally, storing the image of the screen gives you the impression that load operations are extremely fast. It takes about 20 seconds to load a full disk into RAM, but only about 2 seconds to recall the screen data. Rather than waiting impatiently as the disk drive hums along, you're shown your work environment almost immediately, and you can use the remaining load time to figure out what you're going to do.

Low-Hassle Computing
The Cat represents an eye-opening new approach to data storage and retrieval: it will surprise anyone who thought that interface design was a dying art. Though the basic configuration appears on the surface to be a flexible word processor, the Cat's computational, macro, and programming capabilities make it quite possible to build data structures that emulate spreadsheets and databases.

The seeming formlessness of the environment may cause some initial hesitation if you are accustomed to the complexity and rigidity of current application packages, but it's easy enough to start small—with rudimentary typed documents—and graduate to more sophisticated operations as you need them. What's more, you've got the whole thing in a tidy package that clerical workers and executives alike won't find threatening.

Whether the Canon Cat is truly an "information appliance" is hard to say. Its $1495 price tag forces it into competition with low-cost MS-DOS clones and discounted Macintoshes—not a good position for a "people's computer." However, the Cat's unique interface could make it a strong contender; it's certainly worth a look, particularly if you're interested in low-hassle computing.
